

Experimental and Computational Methods in Linguistic Research

Spring 2025

Instructor: Sanghee Kim

Week 7

Agenda

- Reading time and surprisal
- Language model output
- Research proposal
 - Research question
 - Hypothesis
 - Experimental design
 - Methods
 - Analysis
 - Predictions
 - Report

Final presentation

- Sign up for your final presentation (May 20 or May 22)

Understanding reading times

- Why do we see such reading time differences?

The debate

- Memory?
- Expectation?

Surprisal & Psycholinguistics

- In addition to measuring the average information for a language, we can of course measure the **information conveyed by any given linguistic unit** (e.g. phoneme, word, utterance) in context. This is often called *surprisal*:

$$Surprisal(x) = \log_2 \frac{1}{P(x | context)}$$

- **Surprisal will be high**, when x has a low conditional probability, and **low**, when x has a high probability.
- Claim: **Cognitive effort** required to process a word is **proportional** to its **surprisal** (Hale, 2001).

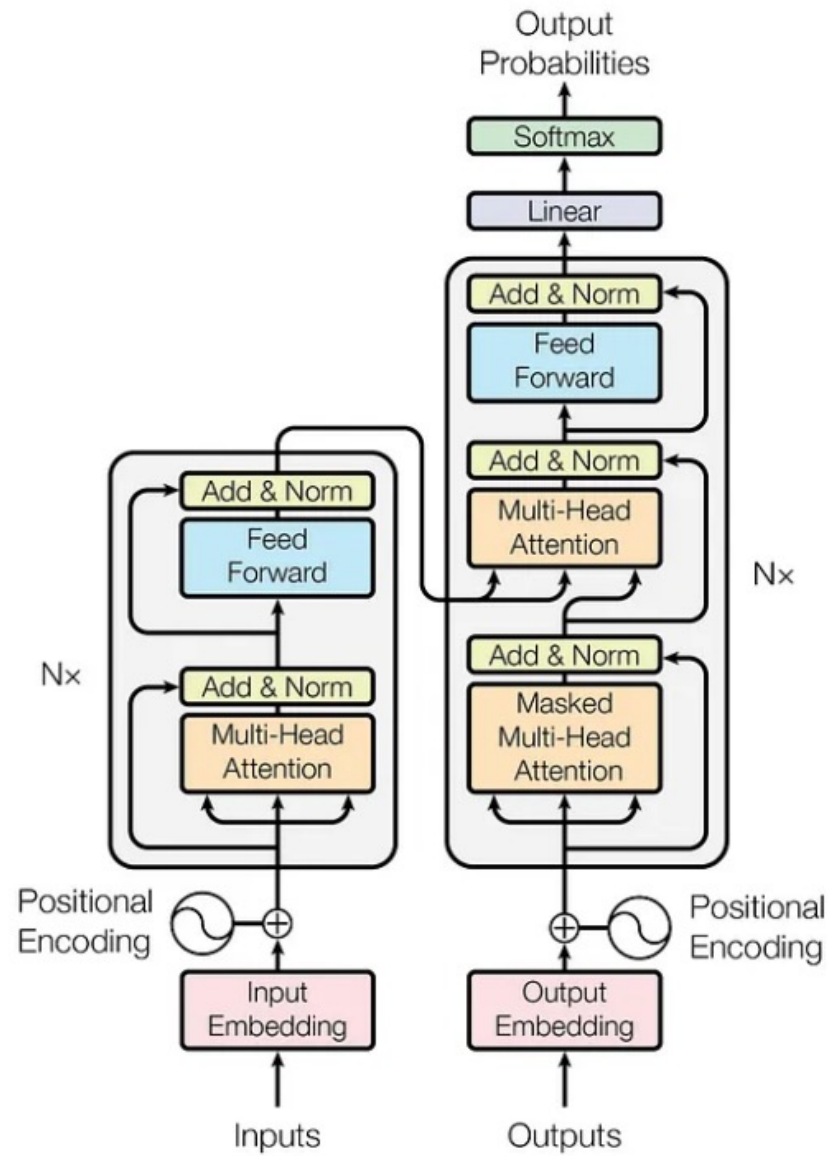

Surprisal and log probability

$$\textit{Surprisal}(x) = \log_2 \frac{1}{P(x \mid \textit{context})}$$

$$\textit{Surprisal}(\mathbf{x}) = -\log_2 P(\mathbf{x})$$

BERT

Encoder

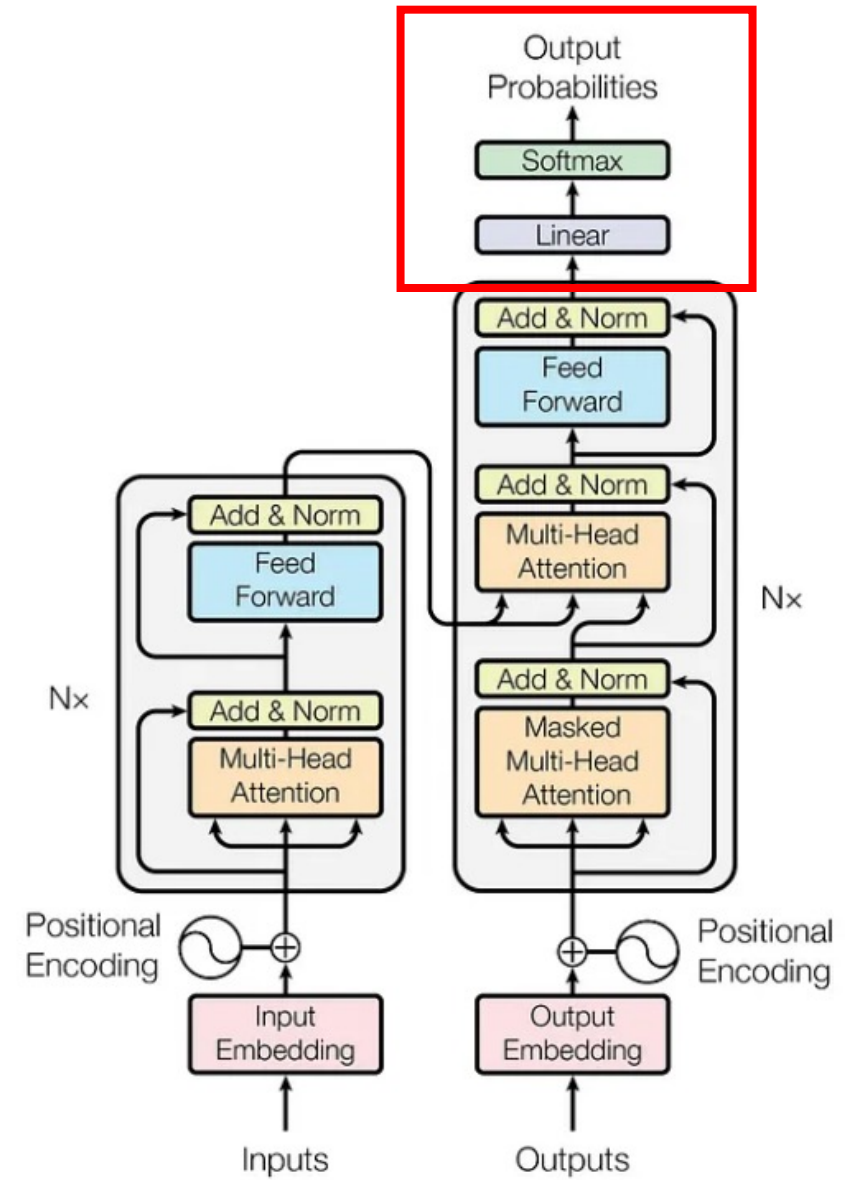

GPT

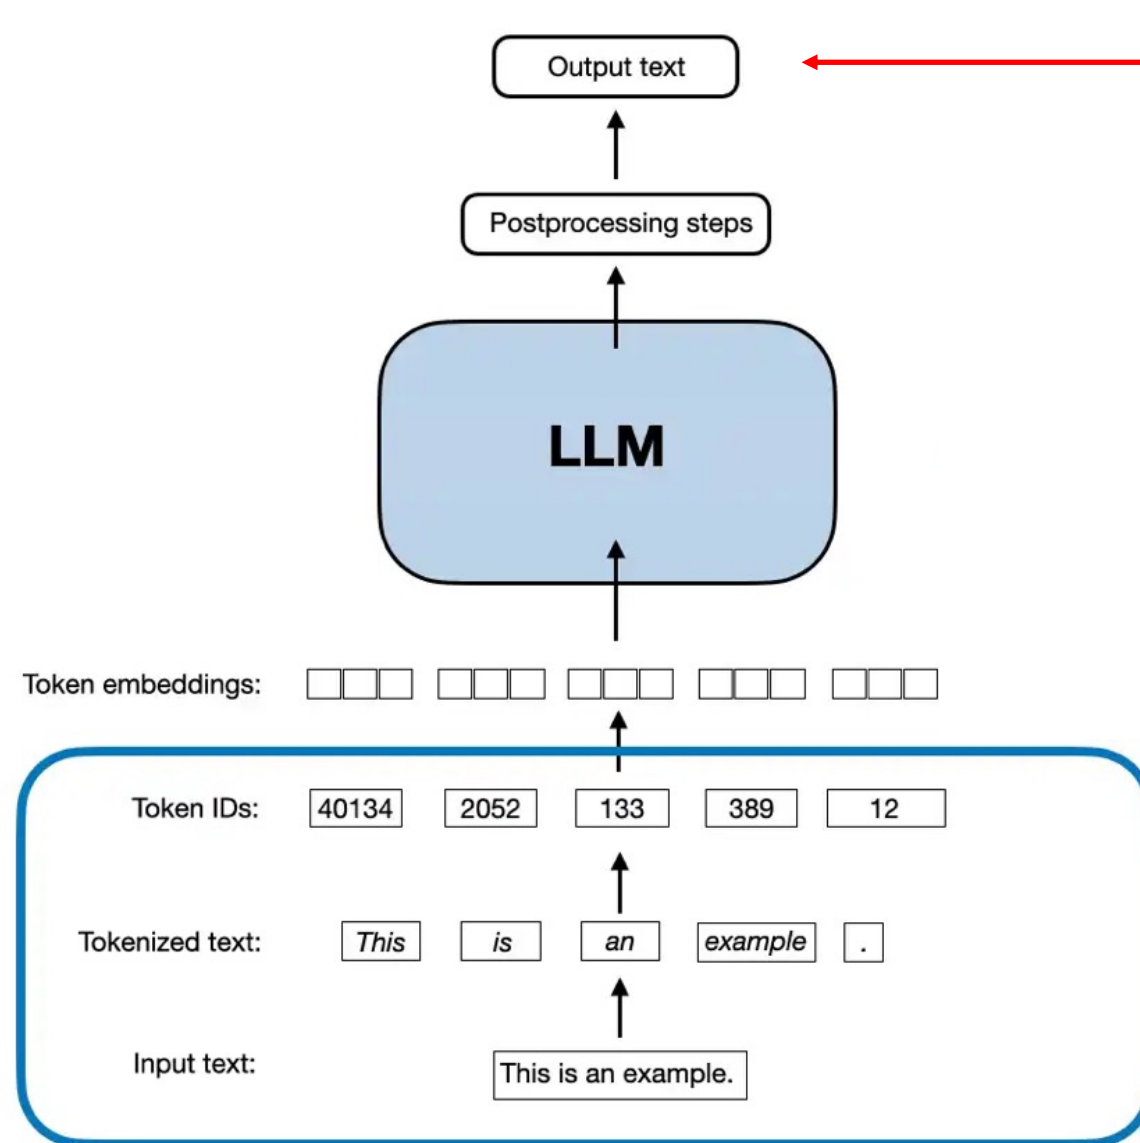

Decoder

Transformer Architecture

- Probability distribution over words

Transformer Architecture

We will access the model output to obtain the probability (and surprisal) of the word (given prior context).

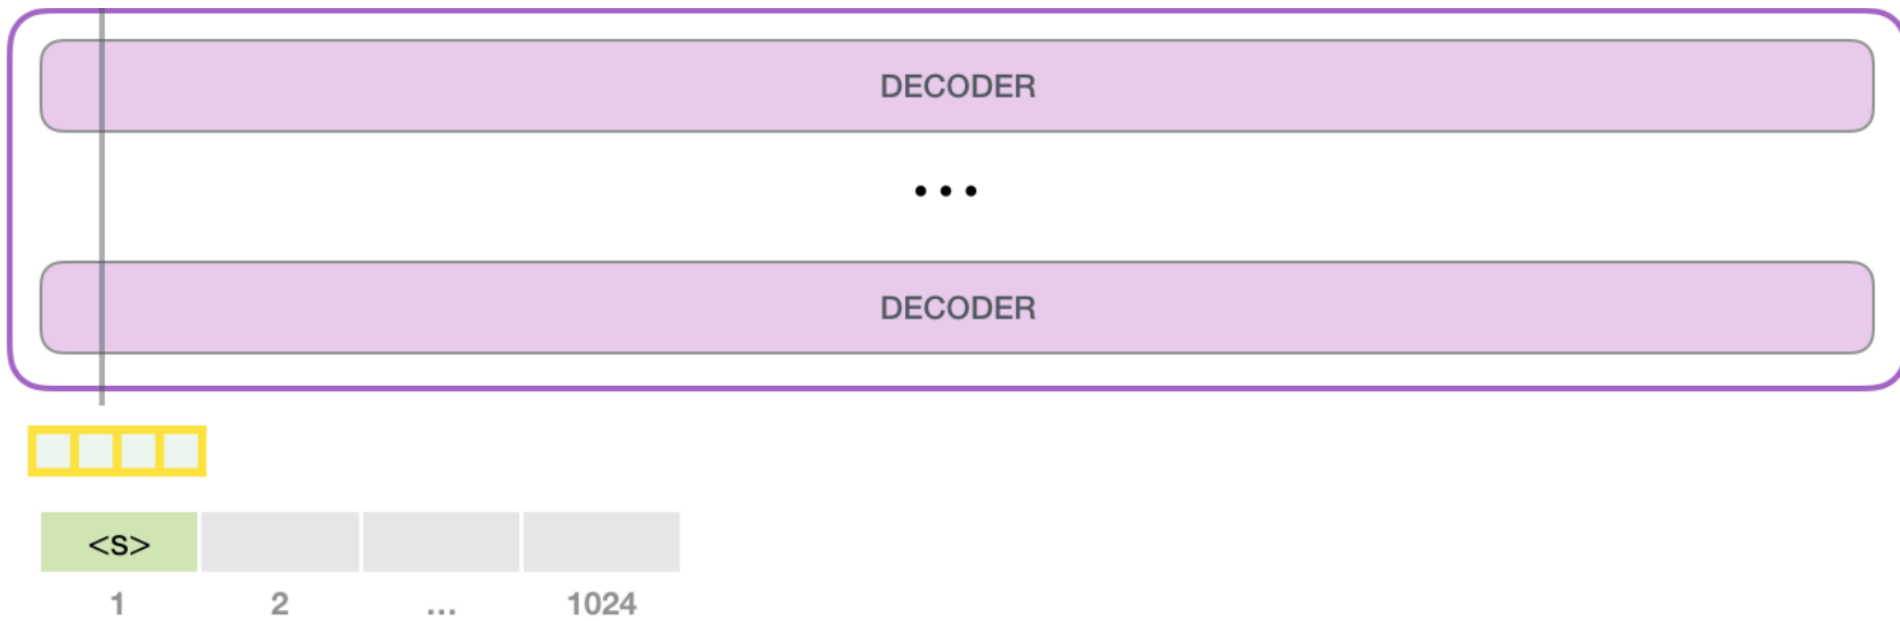

Input

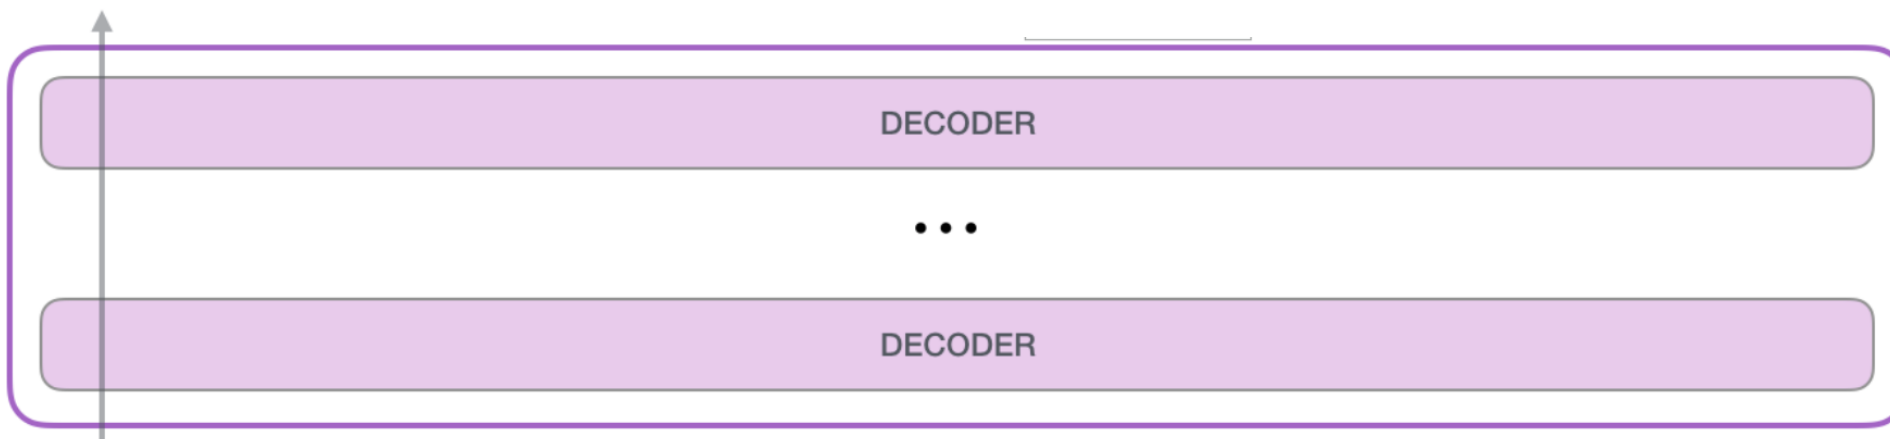

Input tokenization

Decoder #12, Position #1
output vector

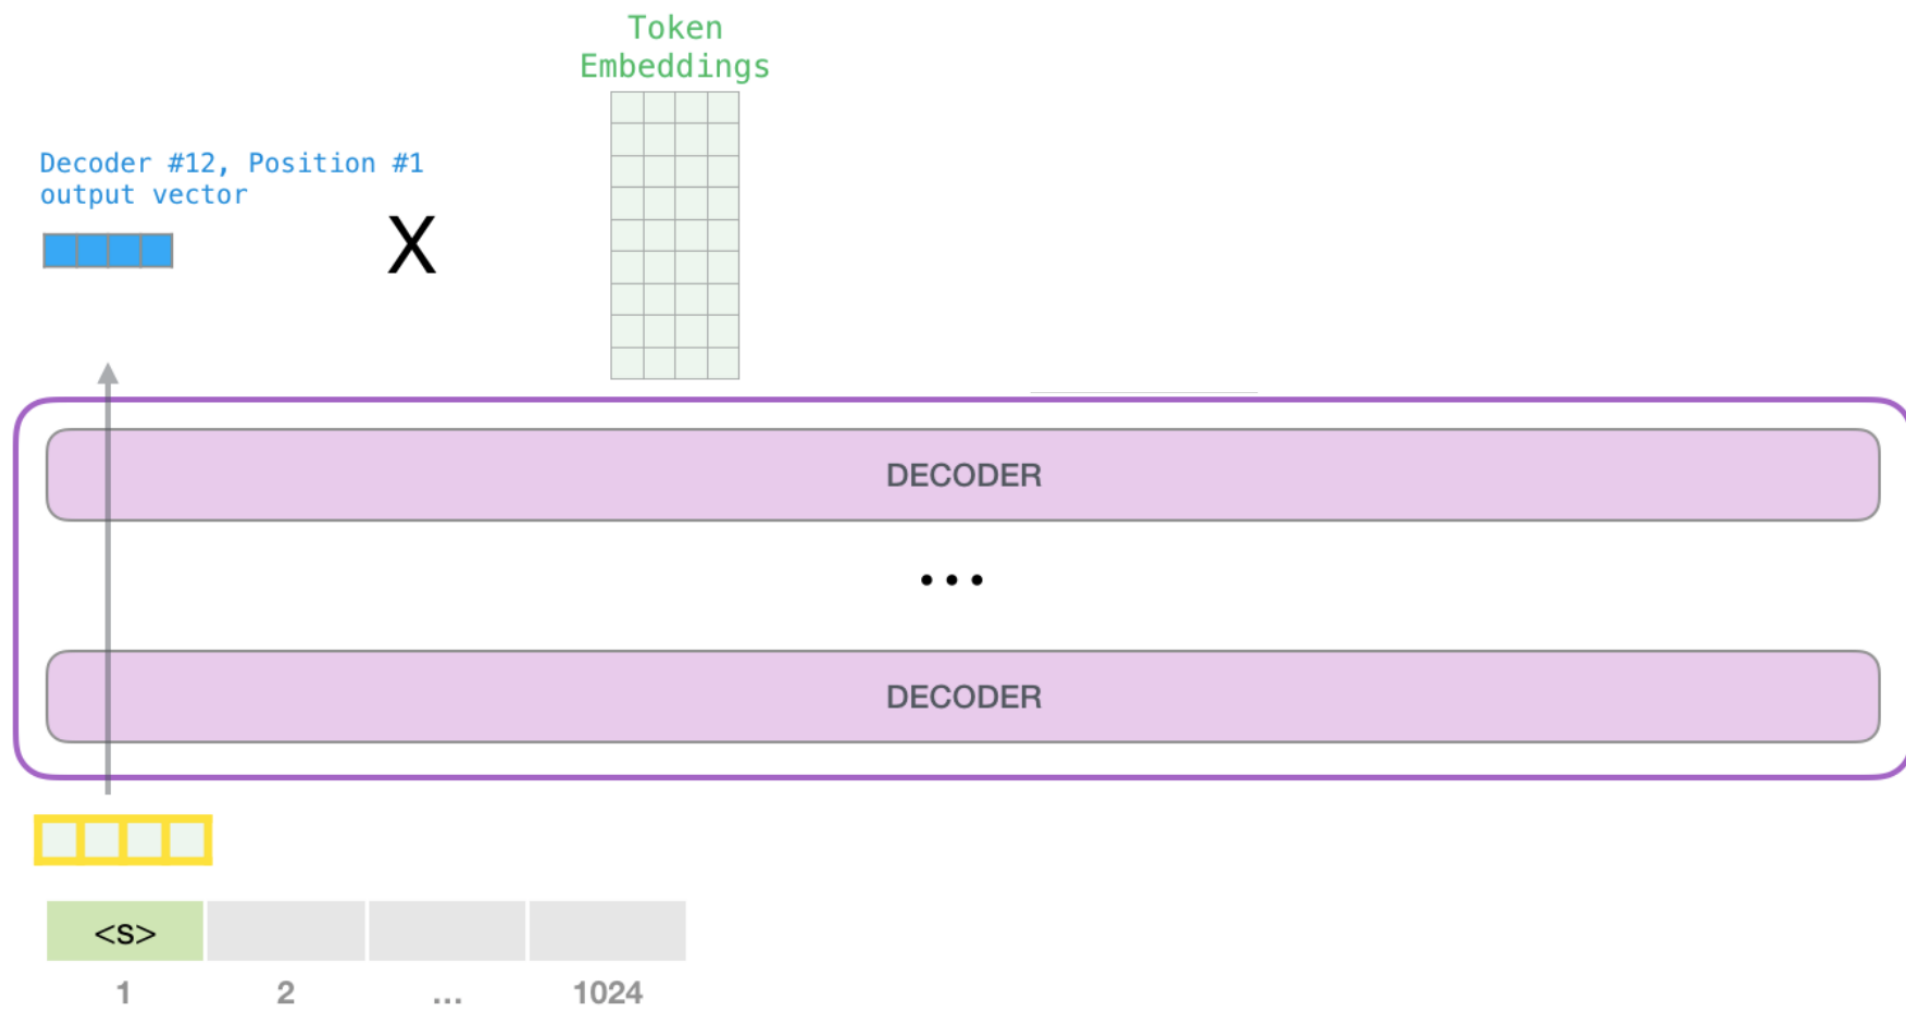

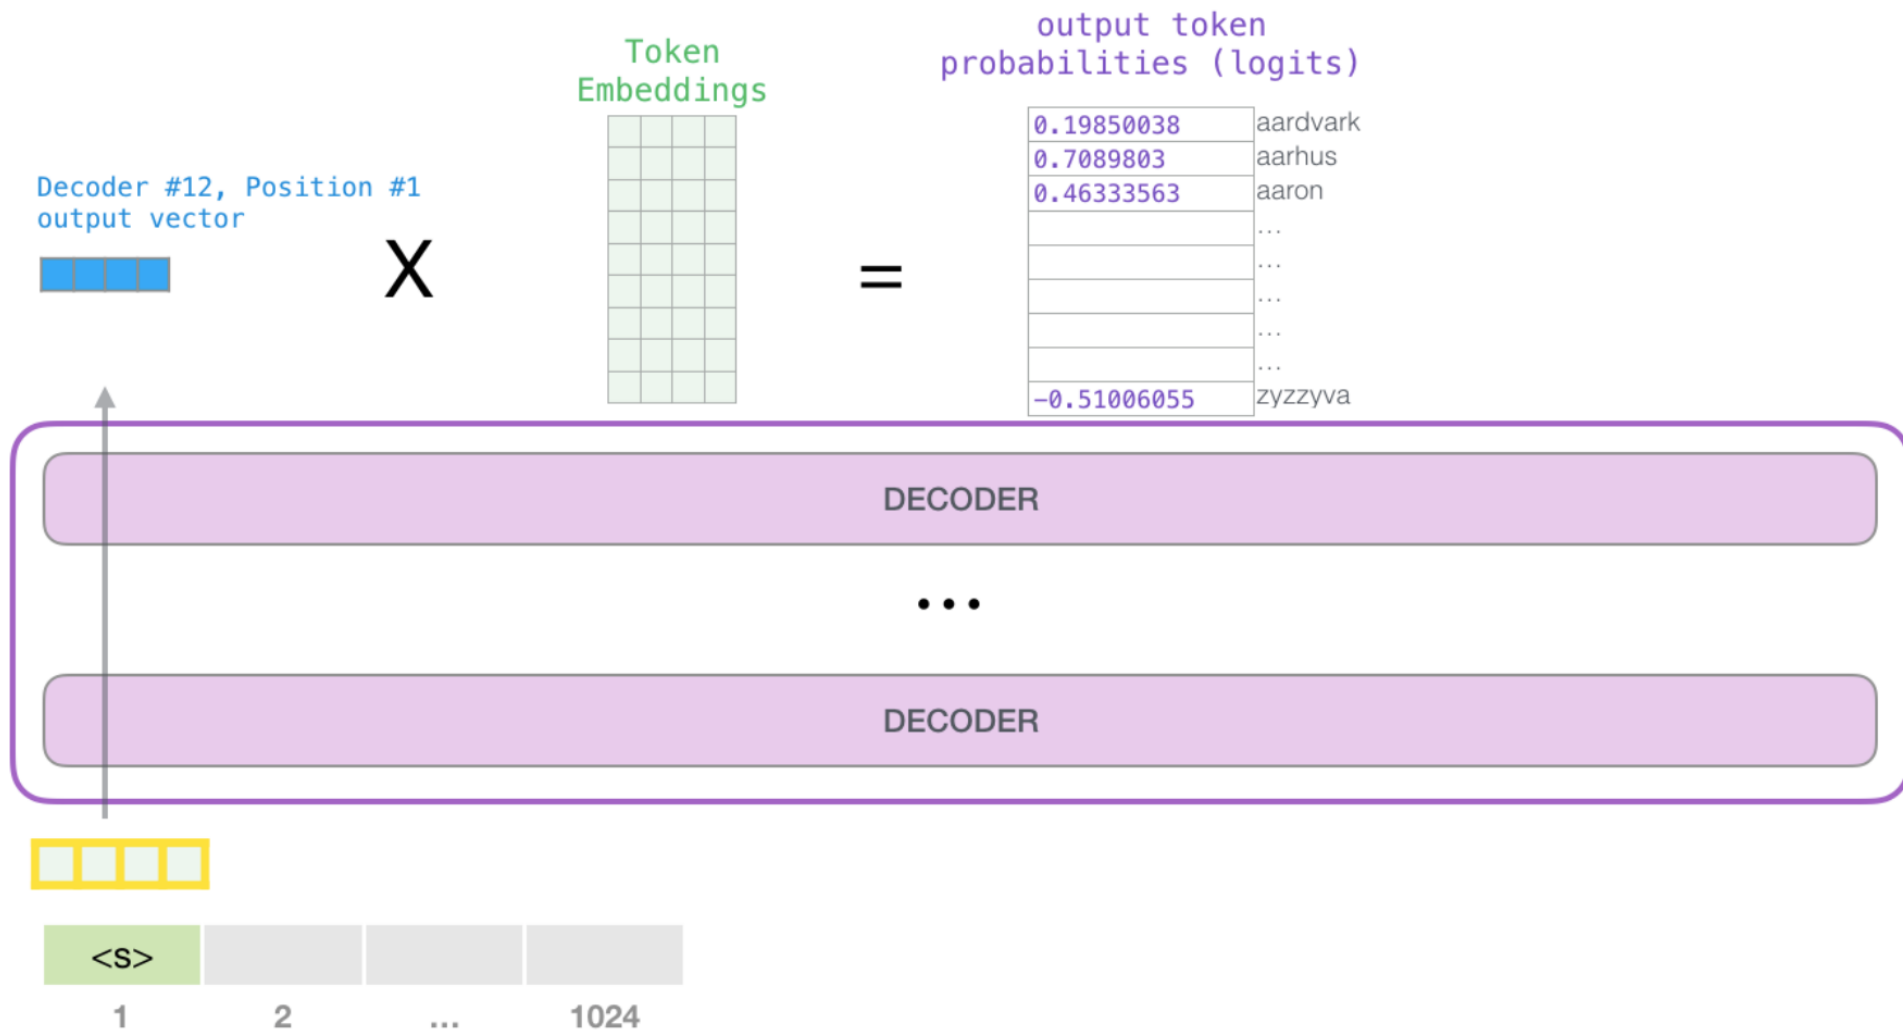

1

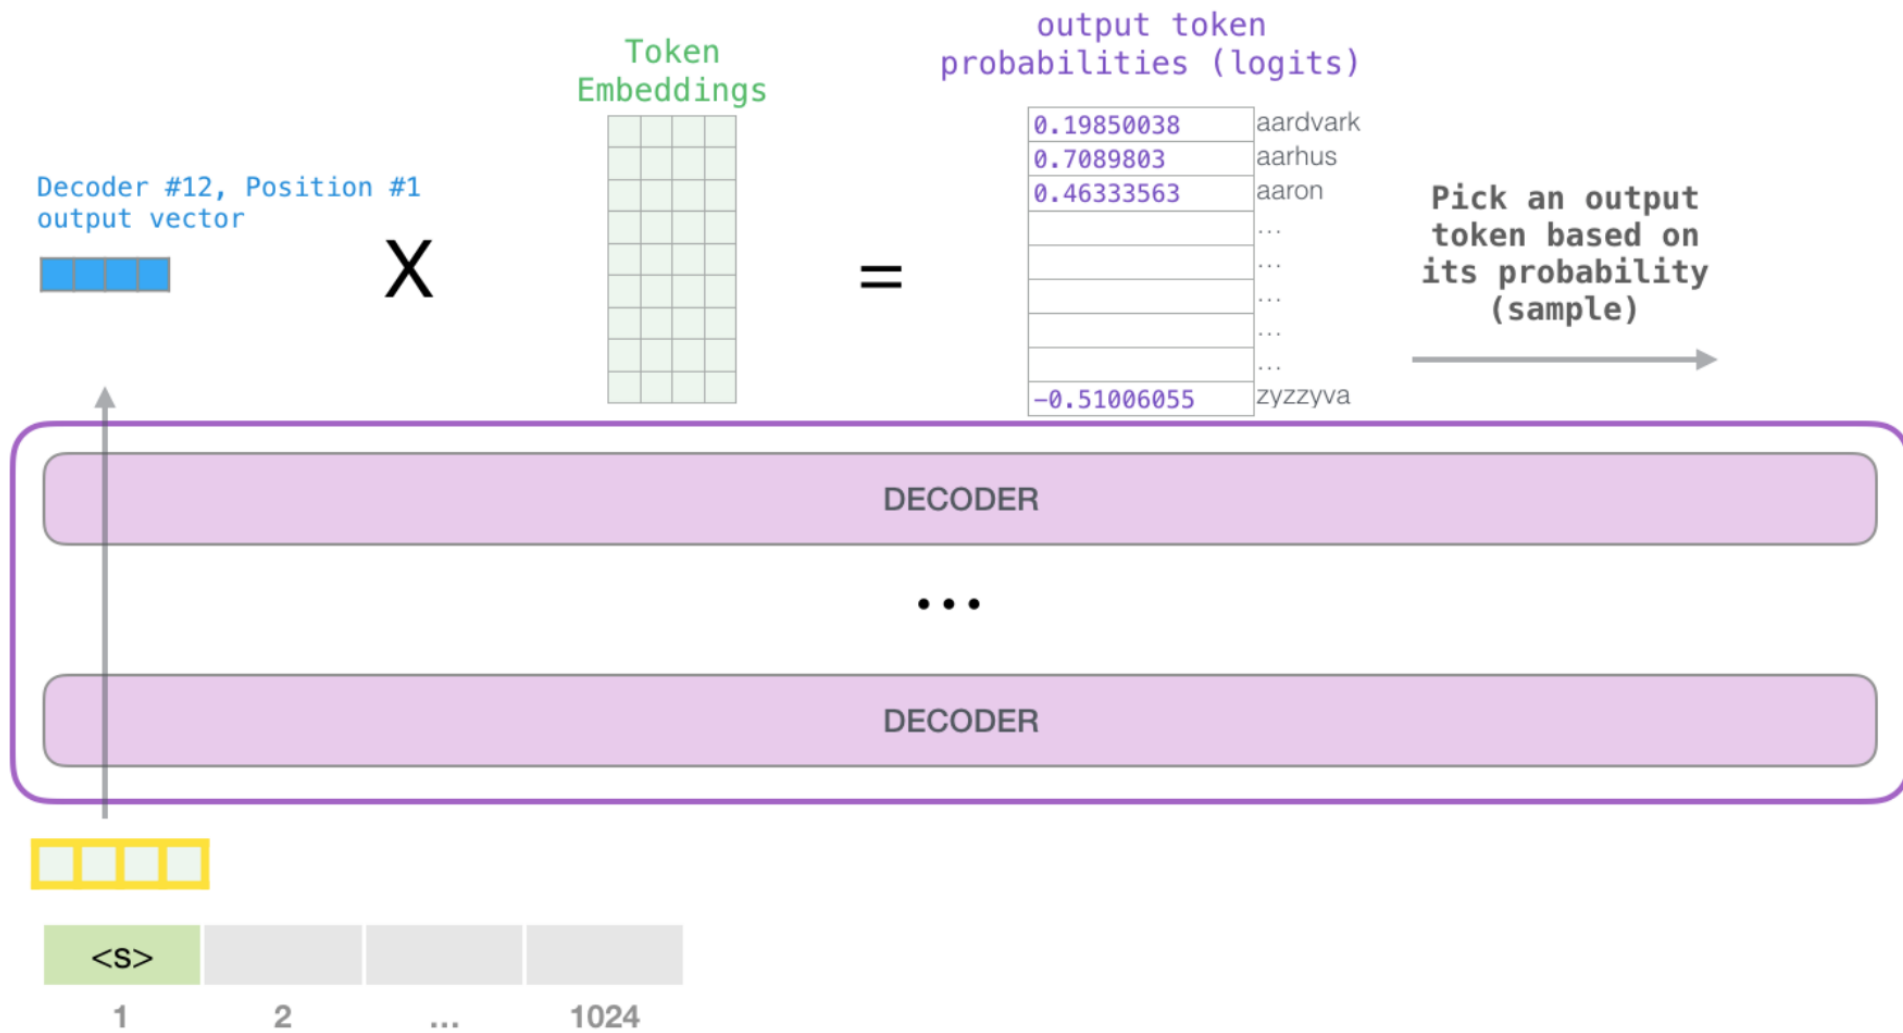

2

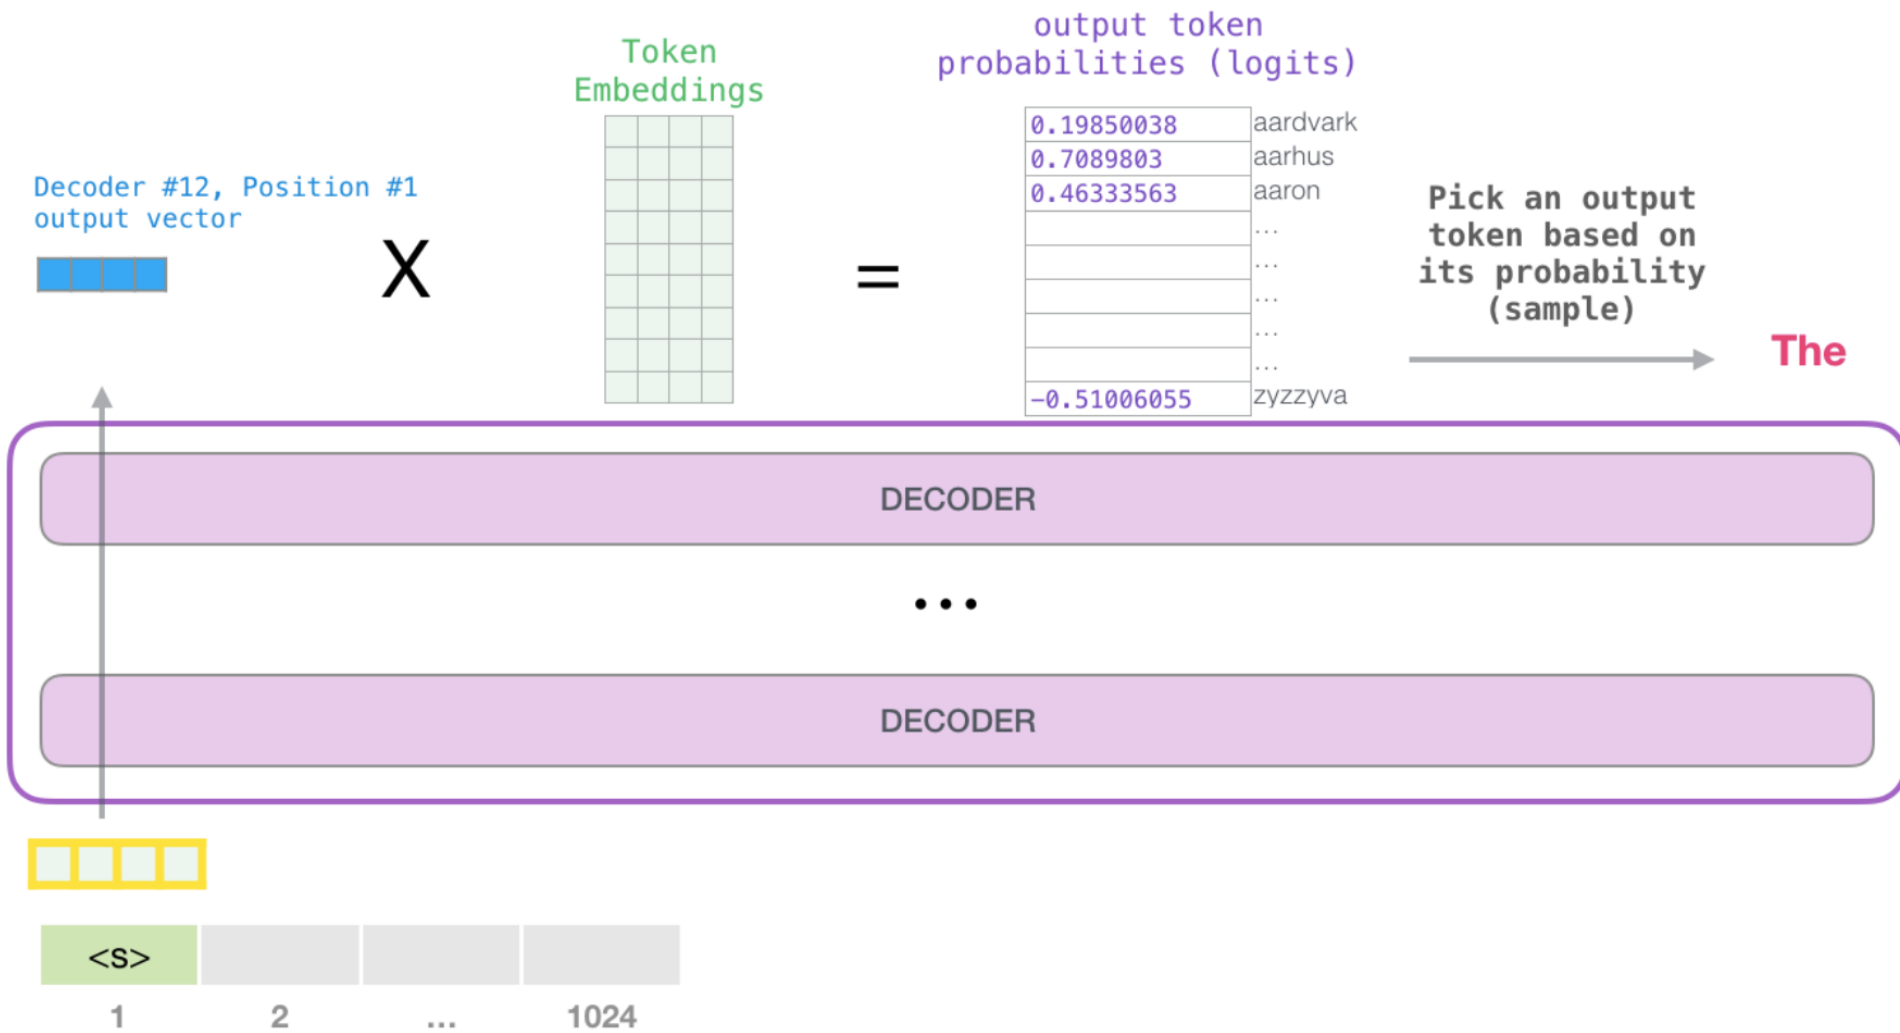

...

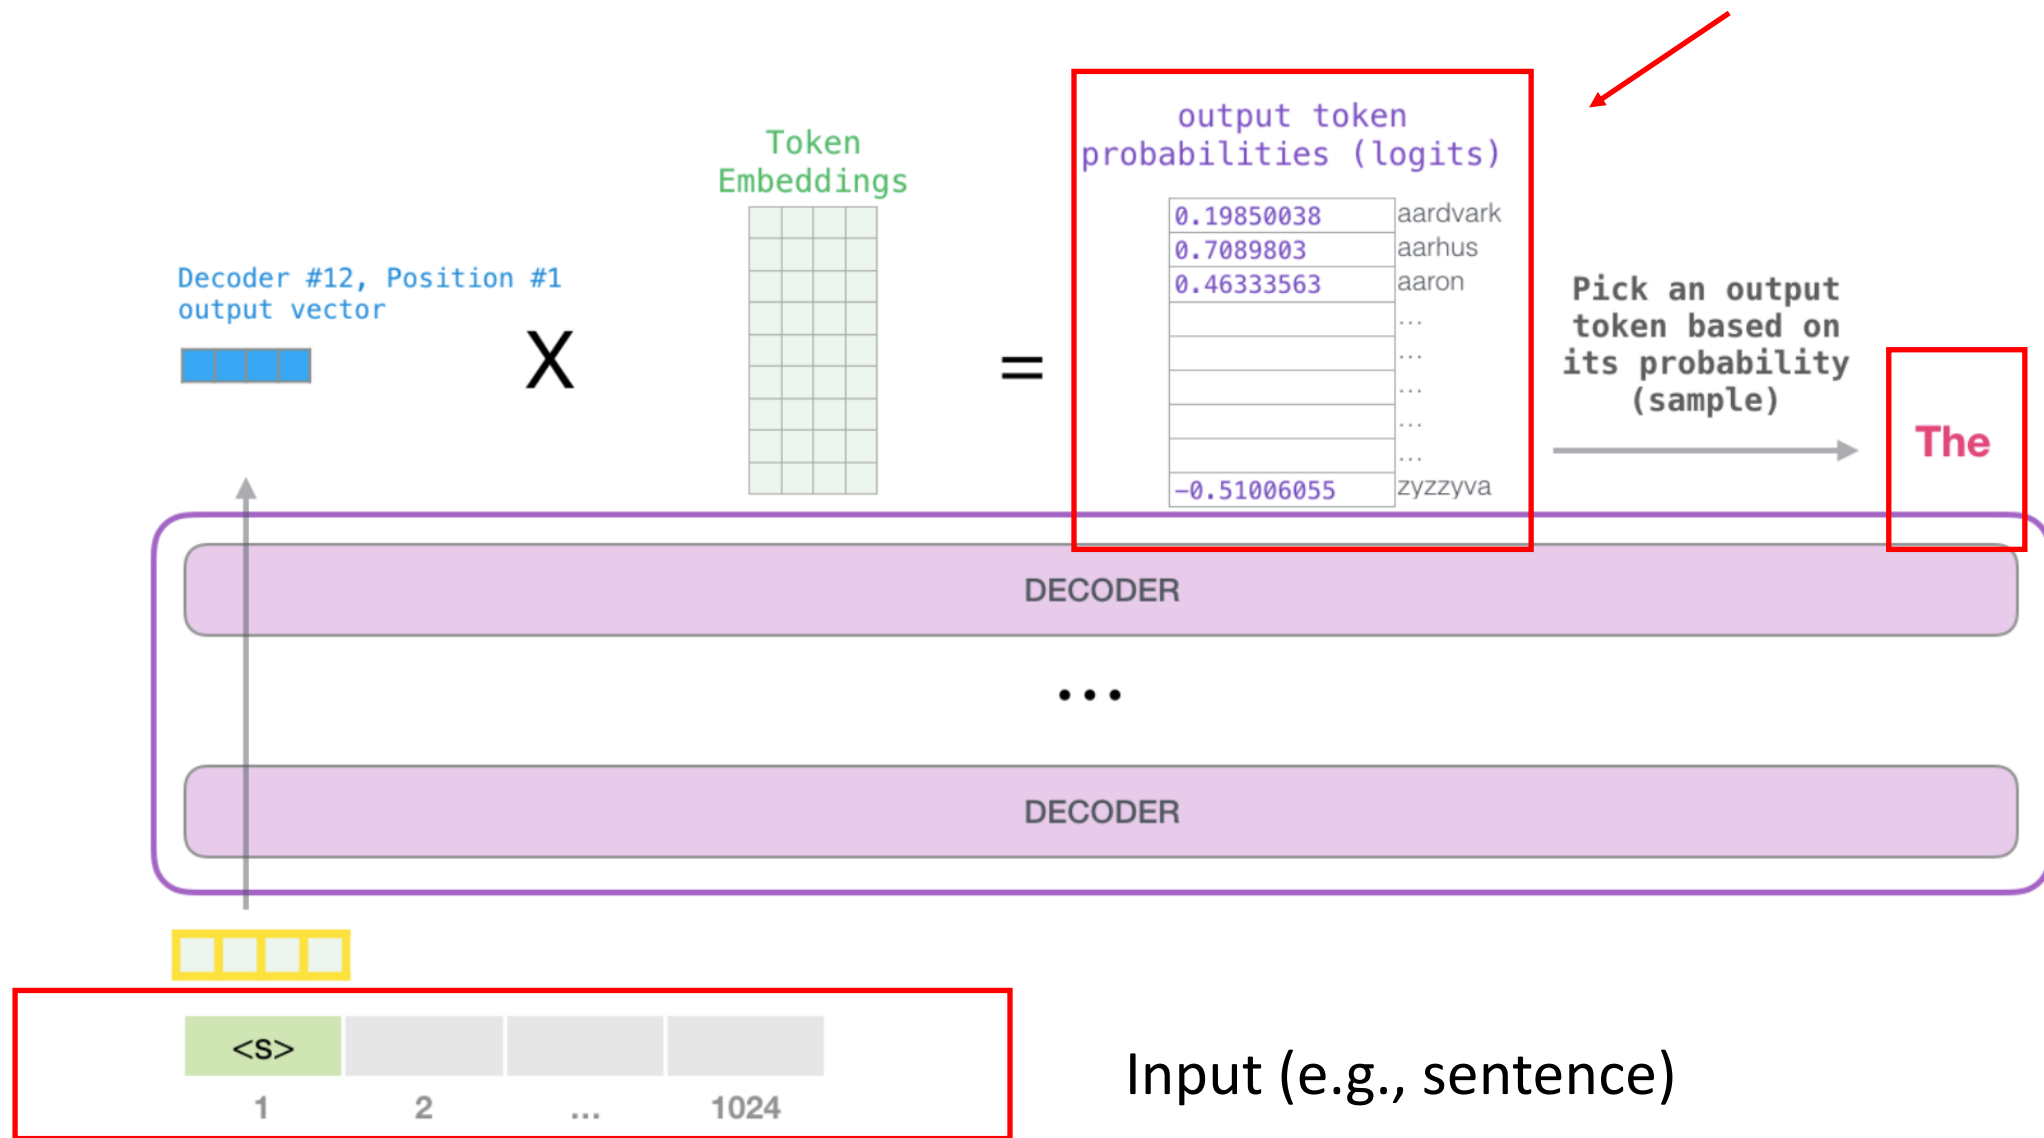

1024

Key notions

- **Model output:** probability over words given prior context.
 - Given context “The key to the cabinet ...”, how likely is it see word_1, word_2, word3, ... word_n?
 - Assigning probability over all “words” in the model vocabulary.

Arehalli & Linzen (2020)

The key to the cabinets...

output token probabilities (logits)

model vocabulary size
50,257

0.19850038	aardvark
0.7089803	aarhus
0.46333563	aaron
	...
	...
	...
	...
	...
-0.51006055	zyzzyva

We will convert this
to **log probability**
and then **surprisal**.

Workflow

Model output
(**logits**)

Convert to **probabilities**
(softmax function)

Logits vs. Softmax Probability

Workflow

Model output
(**logits**)

Convert to **probabilities**
(softmax function)

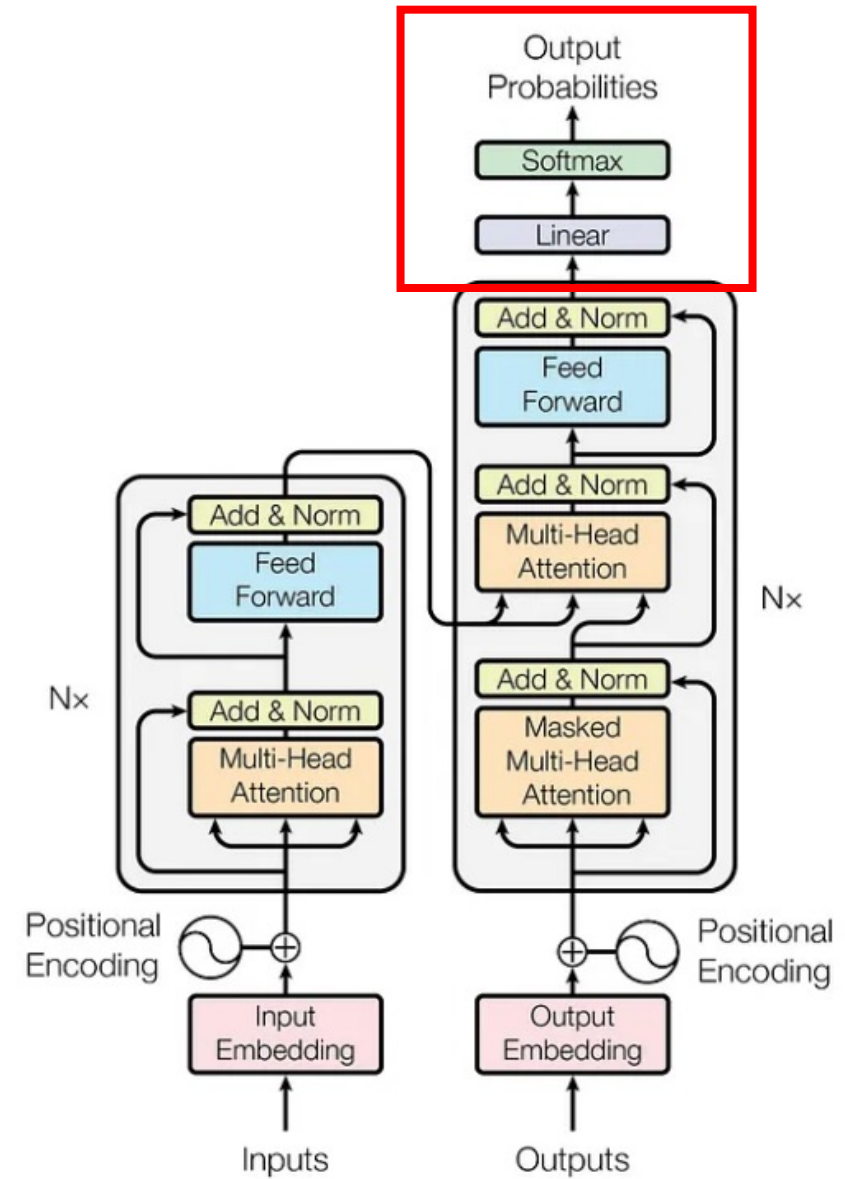

Obtain **surprisal**
Surprisal(x) = $-\log_2 P(x)$

Relationship between Probability, Log Probability, and Surprisal

- Obtain model surprisal at the critical word
- Compare it with human reading time results

Transformer Architecture
